

CAISSA-JEPA | Restricted-label development (v2.2, grid 03)

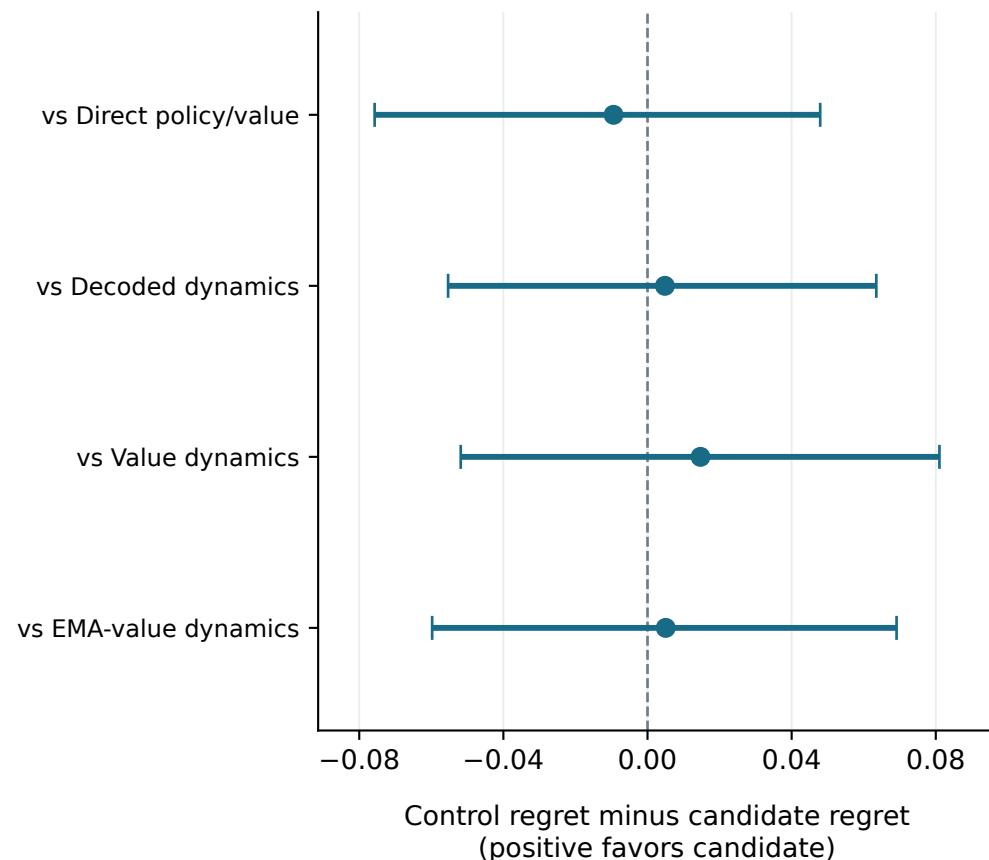

Development screen not passed | Candidate: Raw JEPA

Primary: 25% of training roots selected | One fixed label mask

A Tuned family performance

B Paired effects (95% intervals)

Adaptive development; three training seeds (17, 29, 43). Fixed development roots: Connect4 107, Reversi 102. Intervals describe this development cohort,

do not correct adaptive selection, and do not establish confirmation. All plotted estimates and intervals are read from the verified aggregate report.

Primary regime selects 25% of roots, not 25% of state labels. Intervals condition on one fixed label mask. Full-label sensitivity is not plotted. This simulates label access; no oracle-compute saving is established.
